

# Clicky Gone

Last modified: 13-Mar-09

## What's this?

Clicky gone is a windows hider application. It's used to hide windows on the desktop and the tabs on the task bar.

## Why use it?

If you are running lengthy tasks that's taking up space on the desktop or the task bar, then you could hide it and then come back to it later. If you are in the office and supposed to be doing work but instead are browsing the net, then the boss walks in then just hit the Boss Keys to hide the active window and optionally mute the sound. You can also optionally hide the windows completely or place an icon to show them in the system tray for lazier access. And if you think that's lazy, you can also right click the windows caption or task bar button and select the "Hide" item to hide a window without even a single key press.

## How does it work?

Clicky Gone has almost no user interface; it's basically keyboard and mouse driven. The main access to its features is through "Clicky Gone Config" and the "Clicky Menu". Clicky Gone Config is an external application used to communicate with Clicky Gone. This application is used to set all options of Clicky Gone. And the "Clicky Menu" is used to view hidden windows and can be accessed through the keyboard or the Clicky Gone icon in the system tray (visible if turned on through "Clicky Gone Config")

## The User Interface - AKA Clicky Gone Config

The user interface is pretty much self explanatory, you can access individual features through the menu items on the left and find out about version information and updates by accessing the "About" item. When you have made changes, just hit "Apply"; made mistakes, just hit "Defaults" and click "Exit" to close the configuration application.

The "Start" page lets you see your current setup for each command and is a useful place to go when you forget what keys to press.

## How do I check for updates?

Launch Clicky Gone Config and click on the "About" menu item or click the icon in the system tray and select the "Check For Update..." menu item.

When checking for a new version, your browser will launch and take you to the Clicky Gone website where it will notify you about any new updates.

## Tutorial with default keys:

- Quick hide all windows: Press Control + Alt + F12
- Selective Hide: Press Control + Alt + Left Click Window
- Clicky Gone Menu: Press Control + Alt + Space Bar
- Boss Key: Press Control + Alt + Enter

## Tip:

The Clicky Gone menu has numerical indexes for quick access to hidden windows, just press the number by the menu item to show it.
